FINANCIAL SERVICES

ABC Virtual has worked extensively in the financial services industry including projects in consumer finance and insurance.

Projects in the consumer finance include a system to create a point of sale loan origination application. This system allowed for a customer to make an application for credit at a retail outlet, receive credit approval and then add the loan to the legacy loan processing system. A second project was developed to receive leads for loans that have been turned down by another lending institution, add these leads to a central dialing system and display the information as the leads are dialed. Once a loan has been accepted, the loan information was sent to the legacy loan processing system.

For the insurance industry, ABC Virtual has created a claim system which replaced the claim origination and processing system that was being used. This claim system allowed for the claims adjuster to work off-line and then any modifications were integrated back to the central server. Other functions included in this system were automated claim assignment, activity logging and notification of required actions.
